

Exploratory Data Analysis (EDA) Findings - Titanic Dataset

- **Gender & Survival:** The bar charts clearly show that females had a drastically higher survival rate (over 70%) compared to males (around 20%).
- **Passenger Class Impact:** There is a strong negative correlation between Passenger Class (Pclass) and Survival. Passengers in 1st class had the highest survival rates, while the majority of casualties occurred in 3rd class.
- **Fare Distribution:** The boxplot indicates that 1st class ticket fares had a massive spread and were significantly more expensive, which positively correlated with survival chances (as seen in the heatmap).
- **Age Demographics:** The age histogram shows a normal distribution with a slight right skew, indicating the majority of passengers were between 20 and 40 years old.
